

# OMEGO® Plus with FES

The combination of OMEGO® Plus movement therapy and functional electrical stimulation (FES) allows for dynamic functional motor rehabilitation. Depending on the therapy goal and application, it is possible to stimulate individual muscle groups or several muscle groups at once.

## OMEGO® Plus with FES supports therapy success:

- Provides lower extremity movement
- Helps prevent atrophy
- Increases possible functional recovery of paretic muscles
- Helps maintain structure of paralyzed muscles
- Activation of the cardiovascular system
- Psychological effect
- Prevention of secondary diseases

Therapies using **functional electrical stimulation** are recommended in the S2 Guideline "Lower leg and standing/walking rehabilitation for paraplegic individuals" (2018).<sup>1</sup>
